Model 380580

Battery Powered Milliohm Meter
**Introduction**

Congratulations on your purchase of Extech’s Model 380580 Battery Powered Milliohm Meter. This device offers five resistance ranges with resolution as low as 0.1mΩ. The 4-wire Kelvin clip connection ensures optimum accuracy. Typical applications include transformer, motor coil, and PC Board resistance measurements. This professional meter, with proper care, will provide years of safe reliable service.

**Meter Description**

1. Current Terminals
2. Potential Measurement Terminals
3. LCD Display
4. Start/Stop Test Button
5. Range Select/Power Switch
6. LED Error Lights
   - No Test/Over Temperature
   - $R_P$ Voltage Regulation
   - $R_C$ Current Regulation
7. Current/Range Table

**Leads**

Current Leads- Banana plug to alligator clip
- C1- Green
- C2- Blue

Voltage Potential Leads- Banana plug to alligator clip
- P1- Red
- P2- Black

Kelvin Clips- Banana Plugs (2) to Kelvin Clip
- Red (P1) Green (C1)
- Black (P2) and Blue (C2)

**Measurement Considerations**

1. Do not apply voltage to the meter input terminals. Meter damage may result.
2. Always insure that the circuit to be measured is switched OFF, isolated and completely de-energized before connecting the test leads.
3. If the Over Temperature LED (NO TEST) indicator is lit, allow the instrument to cool down before proceeding further.
4. The $R_C$ led indicates when the test current falls out of regulation. Selecting a higher range may eliminate the condition.
5. The $R_P$ led indicates when the voltage on the device under test is too high. Selecting a lower range may eliminate the condition.
6. If either the $R_C$ or $R_P$ led is on, the measurement may be in error.
7. The current terminals are fuse protected.
8. Keep the potential test leads as short as possible. Long leads may introduce noise.
9. When using the four separate alligator clip leads always place the current leads outside the potential leads.
### Preliminary Checks

#### Current Regulation Check
1. Connect the current leads C1 and C2 to the meter.
2. Set the function switch to the 200.0mΩ range.
3. Momentarily press the TEST Rp button. The meter will intermittently beep and RC will light.
4. Short the current leads C1 to C2.
5. The RC LED should go off, indicating that the meter is operating correctly.
6. Momentarily press the TEST Rp button to stop the test.
7. The meter will return to NO TEST status.

#### Voltage Measurement check
1. With the current test leads C1 and C2 shorted, connect and short the potential (voltage) leads P1 and P2.
2. Set the Function switch to the 200.0mΩ position. The NO TEST status LED will light.
3. Momentarily press the TEST Rp button. (the meter will intermittently beep)
4. The display should indicate 00.0
5. Momentarily press the TEST Rp button to stop the test. The NO TEST status LED will light.
6. Remove the shorts from P1 and P2, and C1 and C2 and
7. Short the test leads P1 to C1 and P2 to C2
8. The Rp LED as well as the NO TEST status LED should light indicating an over-voltage or over-range
9. Turn the rotary selector switch to OFF

#### Polarity check
1. Short the test leads P1 to C2 and P2 to C1 together.
2. Set the Function switch to the 200.0mΩ position.
3. The “-1” negative indicator should appear in the display.

#### Operation check
Use the Kelvin clips for this test
1. Short the all the leads (P1, P2, C2, C1) together. The P1, P2, C2, C1 order is important.
2. Set the Function switch to the 200.0mΩ position. The NO TEST status LED will light.
3. Momentarily press the TEST Rp button. (the meter will intermittently beep)
4. The display should indicate near 00.0 (+/-0.2mΩ) depending on the test clip connections and both Rp and RC LEDs should remain off.
5. Momentarily press the TEST Rp button to stop the test.

**Note:** These tests can be performed on any range.
Measurement Procedure

1. Select the desired measuring range on the meter. If the resistance of the device is unknown, start with the highest range and work downward.

2. Clip the test leads onto the device under test. Note: When using the 4-wire/4 alligator clip test leads, it is recommended that the current test leads be outside of the potential test leads (as shown in the diagram below).

3. For a short test duration of 10 seconds, press the TEST Rp button for less than 2 seconds. This EnerSave™ feature can be used to conserve battery power.

4. For a long test duration of 60 seconds, press the TEST Rp button for more than 3 seconds.

5. During the test, the meter will intermittently beep. At the end of the test or if the test is stopped, “HOLD” will appear and the last reading will be “frozen” on the display.
**Measurement Principles**

The test current flows through the resistance from the **Current+ (C+)** terminal to the **Current - (C-)** terminal. The **P+** and **P- (POTENTIAL)** terminals measure the voltage drop across the device under test only, thus eliminating the lead and contact resistances. The meter displays the resistance based on the test current and the measured voltage; refer to the equation below:

\[ R_x = \frac{V_x}{I_s} \]

Where:
- \( V_x \) is the voltage drop across the device under test;
- \( I_s \) is the test current;
- \( R_x \) is the resistance of the device under test.

**Thermal Effects**

Temperature can have a significant effect on the performance of milliohmeter due to the temperature coefficient of the resistance under test and thermal EMF's across dissimilar conductors.

Most conductors have a large temperature coefficient of resistance

For example: 0.4%/°C for copper. A copper conductor that has a resistance of 10.00m ohm at 20°C will increase to 10.40m ohm at 30°C. This should be taken into account.

A current going through a resistance will also elevate the temperature so duration of the test can also change the resistance.
BATTERY INSTALLATION

**WARNING:** To avoid electric shock, disconnect the test leads from any source of voltage before removing the battery cover.

1. Turn power off and disconnect the test leads from the meter.
2. Open the rear battery cover by removing two screws (B) using a slotted head screwdriver.
3. Insert the batteries into battery holder, observing the correct polarity.
4. Put the battery cover back in place. Secure with the screws.

You, as the end user, are legally bound (**Battery ordinance**) to return all used batteries and accumulators; **disposal in the household garbage is prohibited**!

You can hand over your used batteries / accumulators at collection points in your community or wherever batteries / accumulators are sold!

**Disposal:** Follow the valid legal stipulations in respect of the disposal of the device at the end of its lifecycle.

REPLACING THE FUSES

There are three fuses:

**Power Supply Fuse** 500mA/250V (5x20mm) fast blow

1. The power supply fuse is located in the battery compartment.
2. Remove the two screws to open the battery compartment.
3. Always use a fuse of the proper size and value.

**Current Circuit Fuse** 500mA/250V (5x20mm) fast blow (F2)

1. Fuse protection for the current terminals.
2. If the fuse is blown, the \( R_C \) LED will stay on.
3. The fuse is located under the printed circuit board.
4. There are 4 mounting screws that have to be removed.
5. Two screws are located under the black feet on the bottom of the unit.
6. The other two screws are located in the battery compartment.
7. Remove the battery compartment door and the batteries to access these screws.
8. Always use a fuse of the proper size and value.

**Potential Circuit Fuse** 500mA/250V (5x20mm) fast blow (F1)

1. Fuse protection for the potential terminals.
2. If the fuse is blown, the \( R_P \) LED will stay on.
3. The fuse is located under the printed circuit board.
4. There are 4 mounting screws that have to be removed.
5. Two screws are located under the black feet on the bottom of the unit.
6. The other two screws are located in the battery compartment.
7. Remove the battery compartment door and the batteries to access these screws.
8. Always use a fuse of the proper size and value.
