Congratulations on your purchase of Extech's 45118 Mini Thermo-Anemometer. This meter is shipped fully tested and calibrated and, with proper use, will provide years of reliable service.

1. Select the desired units for air velocity and temperature by momentarily pressing the UNITS/MODE key from a powered down condition. The LCD will show temperature units (°C or °F) and Air Velocity units. Press the UNITS/MODE key repeatedly until the desired units are displayed. When finished, press the ON/OFF/HOLD key momentarily to restart the meter with the desired units.

2. Power the meter by pressing the ON/OFF/HOLD key momentarily. The Dual Display will illuminate. The top (larger) display indicates air speed and the lower display indicates temperature.

3. Position the meter so that the measured airflow enters the meter vane from the rear of the meter (opposite side from the front panel logo, part number, etc.).

4. Activate Data Hold (to freeze the most recent display), by pressing and holding the ON/OFF/HOLD key while taking measurements. To return to normal operation, release the key and restart the meter.

5. Max operation: After a measurement session, press and hold the UNITS/MODE key until the MAX icon appears on the lower left-hand side of the LCD. Both the Air Velocity and Temperature indication will represent the highest readings measured since the meter was last powered.

6. Average mode operation: Normally the meter averages readings every 2 seconds. To select 5, 10 or 13 second averaging, first press and hold the UNITS/MODE key until the AVG icon appears. Next, press the key again to change the averaging interval. The meter will display the selected averaging interval and the average mode is selected. Now press the key again until the AVG icon disappears. Leave it there if an average of 5 seconds is desired. Press the key one more for a 10 second average mode. To return to normal operation press the UNITS/MODE key repeatedly until all lower left-hand icons disappear.

7. Wind chill indicator: Press and hold the UNITS/MODE key until the MAX icon appears. Press the key repeatedly until the WCI icon appears. The temperature display will now factor in the wind chill. To return to normal operation, press the UNITS/MODE key again and the WCI icon will disappear.

8. AUTO POWER OFF: After approx. 15 mins, if meter keys are not touched, the meter automatically shuts down to preserve battery life.

**Battery Replacement**

If the meter will not power up as usual or the display contrast becomes weak and difficult to read, replace the lithium battery. To do so, turn the battery compartment cover in a COUNTER-CLOCKWISE direction. Dispose of the lithium battery in accordance with local, state, or national waste disposal codes.

**Disposal:** Follow the valid legal stipulations in respect of the disposal of the device at the end of its lifecycle.

**Vane Impeller Replacement**

**NOTE:** The anemometer is very accurate at low and mid-range air speeds. Contrast use at very high speeds may damage the impeller’s bearing and reduce over-all accuracy.

1. To replace the impeller, remove the set screw next to the impeller assembly (on the rear of the meter). Twist the impeller assembly counter-clockwise then tighten the set screw.

2. Install the new impeller by inserting and twisting the new impeller assembly clockwise then tighten the set screw.

**CFM Measurements**

Measure the area of the ducting using the diagrams below for rectangular and circular ducts (if the duct measurements are made in inches, divide the inches by 144 to get the area in square feet). Plug the area value (in square feet) into the cubic equations below. Note that the air velocity must be plugged into the cubic equations also.

\[ A = \pi r^2 \]

\[ A = \text{w} \times \text{h} \]

CFM (ft³/min) = Air Velocity (ft/min) x Area (ft²)

CMM (m³/min) = Air Velocity (m/sec) x Area (m²) x 60
